

033. Search in Rotated Sorted Array

033 Search in Rotated Sorted Array

- Binary Search+array

Description

Suppose an array sorted in ascending order is rotated at some pivot unknown to you beforehand.

(i.e., `0 1 2 4 5 6 7` might become `4 5 6 7 0 1 2`).

You are given a target value to search. If found in the array return its index, otherwise return -1.

You may assume no duplicate exists in the array.

1. Thought line

1. Find pivot
2. Do binary search on left half;
3. Do binary search on right half;
4. Binary search processing

2. Binary Search+array

```
1 class Solution {
2
3 private:
4     void binarySearch(vector<int>& nums, int target, int st, int ed, int& res){
5         // finish process condition
6         if (st>ed) return;
7         if (target<nums[st] || target>nums[ed]) return;
8
9         // no target
10        if (st==ed && nums[st]!=target) return;
11
12        // find target
13        if (st==ed && nums[st]==target) res = st;
14
15        // keep finding process
16        else{
17            // middle spot in array
18            int mid = (st+ed)/2;
19            if (target<=nums[mid])
20                binarySearch(nums, target, st, mid, res);
21            else
22                binarySearch(nums, target, mid+1, ed, res);
23        }
24    }
25
26 public:
27     int search(vector<int>& nums, int target) {
28         int res = -1;
29         int pivot = 0;
30         if (nums.empty()) return -1;
31         // find pivot
32         for (int i = 1; !nums.empty() && i<=nums.size()-1; ++i){
33             if (nums[i-1]>nums[i]){
34                 pivot = i;
35                 break;
36             }
37         }
```

```
37     }
38     // process binary search on left half
39     binarySearch(nums, target, 0, pivot-1, res);
40     // process binary search on right half
41     binarySearch(nums, target, pivot, nums.size()-1, res);
42     return res;
43 }
44 };
```
