

096. Unique Binary Search Trees

096. Unique Binary Search Trees

- Dynamic Programming + tree

Description

Given an integer n , generate all structurally unique **BST's** (binary search trees) that store values $1 \dots n$.

For example,

Given $n = 3$, your program should return all 5 unique BST's shown below.

1. Thought line

1, 2, ..., n

Binary Search Tree: left child < node < right child

$n=1: \{1\} = 1$

$n=2: \{1, 2\} = 2$

(1) ① | 2

(2) 1 | ②

$n=3: \{1, 2, 3\} = 5$

(1) ① | 2, 3

(2) 1, ② | 3

(3) 1, 2, ③

$n=4: \{1, 2, 3, 4\} = 14$

(1) ① | 2, 3, 4
5

(2) 1, ② | 3, 4
2

(3) 1, 2, ③ | 4
2

(4) 1, 2, 3, ④
5

$\Rightarrow 1, 2, 3, \textcircled{i}, i+1, \dots, n$

$i-1$

$n - (i+1) + 1 = n - i - 1 + 1 = n - i$

2. Dynamic Programming + tree

```
1 class Solution {
2 public:
3     int numTrees(int n) {
4         vector<int> uniqueBST(n+1, 1);
5
6         for (int i=2; i<=n; ++i){
7             int uniqueBSTofCurrentNode = 0;
8             for (int node = 1; node<=i; ++node){
9                 int leftNodeNum = node-1, rightNodeNum = i-node;
10                uniqueBSTofCurrentNode += uniqueBST[leftNodeNum]*uniqueBST[rightNodeNum];
11            }
12            uniqueBST[i] = uniqueBSTofCurrentNode;
13        }
14        return uniqueBST[n];
15    }
16 };
```
