081. Search in Rotated Sorted Array II

081 Search in Rotated Sorted Array II

• Binary Search+Array

Description

Follow up for "Search in Rotated Sorted Array": What if duplicates are allowed?

Would this affect the run-time complexity? How and why?

Suppose an array sorted in ascending order is rotated at some pivot unknown to you beforehand.

```
(i.e., 0 1 2 4 5 6 7 might become 4 5 6 7 0 1 2).
```

Write a function to determine if a given target is in the array.

The array may contain duplicates.

- 1. Thought line
- 2. Binary Search+Array

```
##midEd;
if (target=nums[midSt])
    binarySearch(nums, target, st, midSt-1, res);
else
    binarySearch(nums, target, midEd+1, ed, res);
}

public:
bool search(vector<int>% nums, int target) {
    bool res = false;
    int pivot =0;
    if (nums.empty()) return false;
    // find pivot
    for (int i = 1; 'nums.empty() && i<=nums.size()-1; ++i){
        if (nums[i-1]=nums[i]){
            pivot = i;
            break;
        }
    }
    // process binary search on left half
    binarySearch(nums, target, 0, pivot-1, res);
    // process binary search on right half
    binarySearch(nums, target, pivot, nums.size()-1, res);
    return res;
}
</pre>
```
